1.0 INTRODUCTION

1.1 Purpose

Pollution of surface waters and ground waters results from human activities associated with our everyday sanitation needs and work related activities. Polluting matter generated by these activities can enter the environment by way of a direct discharge through a pipe (point source discharge) or by runoff or percolation through the ground (diffuse source discharge).

The Water Framework Directive sets objectives concerning the reduction of polluting matter entering waters, prevention of the deterioration in water quality and the achievement of Good Status in all waters. The Directive requires that measures are put in place to achieve these objectives.

Local Authorities have responsibility for the collection and treatment of urban waste water. Discharges of urban waste water are known to impact on the quality of the receiving waters. Regulations are in place concerning the control of discharges from urban agglomerations. Compliance with existing regulations will contribute significantly to the achievement of the objectives of the Water Framework Directive. However, there are circumstances where compliance with existing regulations may not be sufficient. In such cases additional measures may be required.

The purpose of this document is to explain the methodology used to identify measures to be implemented concerning discharges from urban waste water treatment plants.

1.2 Classification of Surface & Groundwaters

The Environmental Protection Agency has classified the overall ecological status of surface water bodies. The ecological status considers the biological status and the chemical status. The classification system includes five designations:-

- High status
- Good status
- Moderate status
- Poor status
- Bad status

Nationally 46 % of all river water bodies and 37% of transitional and costal water bodies have been classified as less than Good status. The Water Framework Directive requires that measures are put in place to restore all water bodies to Good Status. In addition, measures must be put in place to ensure that there will be no deterioration in status. Therefore, measures will be required to protect existing High and Good Status waters from deterioration where there are pressures on such water bodies that may cause deterioration of status.

1.3 Impacts from Discharges from Urban Waste Water Treatment Plants

Water quality is impacted by discharges from urban waste water treatment plants. The level of impact depends upon the magnitude of the discharge and the ability of the receiving water to assimilate the pollution loading without affecting water quality status.

Nationally there are upwards of 900 discharges from urban waste water treatment plants. Nationally, the daily pollution loading entering waste water treatment plants approximates to:

- 380 tonnes BOD
- 47 tonnes Nitrogen
- 8 tonnes Phosphorous

Many of our rivers, lakes, estuaries and coastal waters that receive discharges from urban waste water treatment plants are classified as less than good status according to the classification system developed for the purpose of implementing the Water Framework Directive. It is evident that in many cases, discharges from urban waste water treatment plants are the cause, or contribute to the less than good status.

There is evidence from monitoring data to indicate that discharges from wastewater treatment plants are, or may be, the primary cause of the less than good status. The evidence may be further supported by information indicating that there is insufficient dilution available in the receiving waters to assimilate the pollution loading from the discharge from the treatment plant. In addition there is a risk of deterioration in water quality status were treatment plants are at or approaching design capacity and where the performance is not in accordance with specified discharge standards. The failure to properly operate and maintain a treatment plant also poses a risk to the receiving water quality.

2.0 EXISTING LEGISLATION

2.1 Urban Waste Water Treatment Regulations (S.I. 254 of 2001)

The Urban Waste Water Treatment Directive and the implementing Regulations have been the primary legislative instruments concerning discharges from urban waste water treatment plants. The regulations have obligations for Local Authorities in respect of the collection, treatment, and monitoring of urban waste water.

In the case of urban waste water entering collection systems, a sanitary authority shall provide:

- Secondary treatment or equivalent treatment
 - in respect of all discharges to coastal waters with population equivalents greater than 10,000.
 - in respect of discharges to fresh waters and estuaries, agglomerations with a population equivalent equal to or greater than 2,000.
- More stringent treatment than secondary treatment for all discharges from agglomerations with a population equivalent of more than 10,000 into sensitive areas or into the relevant catchments of sensitive areas where discharges contributed to the pollution of these areas.
- Discharge from a treatment plant intended to provide secondary treatment shall comply with concentration values and minimum percentage reduction values stated in the Regulations.
- Discharge from a treatment plant that is intended to provide more stringent treatment shall comply with the concentration and minimum percentage reductions for Total Phosphorous and Total Nitrogen stated in the Regulations.
- A sanitary authority shall carry out, cause to be carried out or arrange for monitoring of discharges and waters subject to a discharge where there is a risk to water quality. The results of monitoring are to be submitted to the EPA.

The implementation of the Regulations has resulted in significant investment in waste water treatment. However, the rapid growth in the economy in the 10 year period leading up to 2007 has resulted in commercial and residential development beyond anticipated growth levels leading to deficits in waste water treatment capacity and infrastructure. The continued implementation of the Regulations through the Water Services Investment Programme will be necessary to address this imbalance.

2.2 European Communities (Quality of Shellfish Waters) Regulations (S.I.268 of 2006)

The purpose of S.I. 268 is to give effect to Directive 79/923/EEC on the quality required of shellfish waters. The regulations require that public authorities perform their functions in a manner that will promote compliance with the quality standards set out in the Regulations and shall take such actions necessary to comply with any programme established by the Minister in accordance with the regulations.

Pollution Reduction Programmes (PRPs) have been prepared for shellfish waters. These are expected to be approved by the Minister in 2010. Once approved, it will become incumbent on Local Authorities to implement measures that are contained in the PRPs that are relevant to their functions.

The PRPs identify the pressures in the catchments of shellfish waters (including discharges from waste water treatment plants) and the measures to be implemented as part of the action programme. Local Authorities will be required to implement this action programme.

2.3 Waste Water Discharge (Authorisation) Regulations S.I. No. 684 of 2007)

The Waste Water Discharge Authorisation Regulations were made, in addition to other purposes, to prevent and reduce the pollution of waters by waste water discharges and for the purposes of giving effect to Article 11(3)(c) of the Water Framework Directive requiring prior regulation of point source discharges.

The regulations introduce a system of licensing by the EPA of discharges of waste water from urban waste water treatment plants. Local Authorities are required to apply for a licence and to comply with the conditions attached to any licence issued by the EPA.

The Regulations also require planning authorities and An Bord Pleanála to refuse permission or approval of a development, or limit the scale of a development that involves a waste water discharge from a waste water works where it considers that the discharge would cause or exacerbate a breach of emission limits and controls.

3.0 IDENTIFICATION AND PRIORITISATION OF MEASURES FOR WASTE WATER TREATMENT PLANTS

3.1 Sources of Information

3.1.1 Information compiled by the EPA

Local Authorities are required to submit, on an annual basis, information to the EPA on the treatment and discharge of urban waste water within their functional area. Information must be submitted for all agglomerations with a population equivalent of 500 or greater. The information submitted by the local authorities is referred to as the Local Authority Returns. The information returned by the local authorities is compiled in a national database by the EPA. This database represents the most comprehensive record of urban waste water discharges.

3.1.2 Applications for Licences to Discharge

The introduction of the Regulations concerning the authorisation of discharges of urban waste water provided a means of checking, verifying and updating the information contained in the EPA database. The application for a discharge licence required the applicant to submit detailed information on the waste water treatment plant and the receiving waters including:-

- Coordinates for the discharge point
- Population equivalent of the catchment served by the WWTP
- Quantity of flow to the WWTP
- Information on approved developments
- Design Capacity of the WWTP
- Information on treated effluent monitoring data
- Information on receiving water quality

The information extracted from the discharge licence applications was considered to be more accurate than the information contained in the EPA database. Where there was a conflict in the information, the details in the licence application was taken to be more correct and used in the preparation of the programme of measures.

3.2 Identification of Measures

3.2.1 Measures Intended to Achieve Compliance with Existing Legislation

The programme of measures is required to include measures necessary for compliance with existing legislation. With regard to urban waste water treatment plants the Urban Waste Water Treatment Regulations and the Regulations concerning the Quality of shellfish waters must be complied with. Compliance is mandatory and therefore any measures identified were considered to be of the highest priority in the programme of measures.

A review of the data on waste water treatment plants was carried out to identify agglomerations and treatment plants where measures were necessary to ensure compliance with existing legislation. All agglomerations and treatment plants were tested against the primary requirements of the legislation.

Test carried out for compliance with existing legislation is shown in Figure 1.

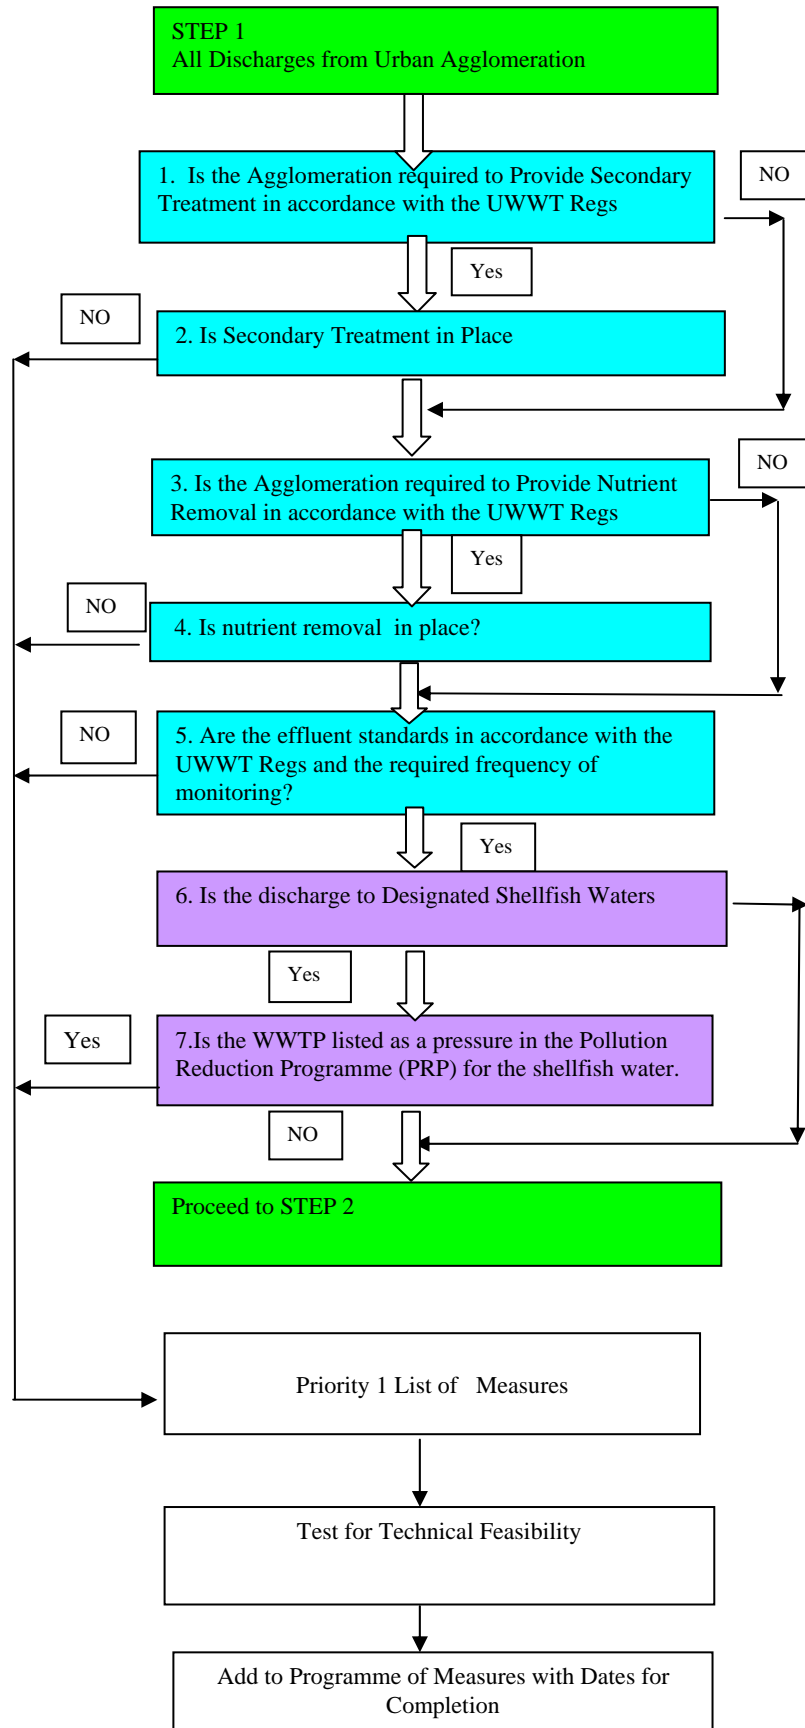

Figure 1 – Test for Compliance with Existing Legislation

Each agglomeration and wastewater treatment plant was tested against Items 1 to 7 in Figure 1 and appropriate measures identified as follows.

1. Is the waste water from the agglomeration required to receive secondary treatment?
2. Is secondary treatment in place?
Were this requirement was not being complied with the measure is *provide secondary treatment* (Table 1 – Appendix A)
3. Is the waste water from the agglomeration required to be subject to nutrient removal?
4. Is nutrient removal in place?
Were this requirement was not being complied with the measure is *provide nutrient removal* (Table 1 – Appendix A)
5. Are the effluent standards in compliance with the requirements of the Regulations?
Has the required number of samples been taken?
Where these requirements have not being complied with the measure is *implement an appropriate performance management system.* (Table 4 – Appendix ?)
6. Is the waste water treatment plant discharging to designated shellfish waters?
7. Is the waste water treatment plant identified in the PRP as a pressure to the quality of such waters?
If the wastewater treatment plant is identified in the PRP the measure is *commence implementation of the PRP.* (Table 3 – Appendix C)

3.2.2 Measures Intended to Address Identified Impacts or Risks to Status

3.2.2.1 A receiving water is at risk from a discharge from a waste water treatment plant where there is a deficiency in the capacity at the treatment plant or where the receiving water does not have sufficient flow to provide dilution of the discharge to meet water quality standards. In addition, monitoring in the receiving water may indicate that the discharge is contributing to the deterioration in quality status. Furthermore some receiving waters may be designated as protected areas. Such areas should receive priority in the implementation of the measures in consideration of their special status.

3.2.2.2 Biological river water quality monitoring is carried out by the EPA. The EPA monitoring programme includes approximately 3150 monitoring stations covering 13,000km of river channel. The results of monitoring are reported in accordance with the EPA's Q-rating classification system. The relationship between the Q-rating and the biological quality required for good status under the Water Framework Directive is as follows:

Q Value	WFD Quality Status
Q5,	High
Q4, Q4-Q5	Good
Q3, Q3-Q4	Moderate
Q2, Q2-Q3	Poor
Q1, Q1-Q2	Bad

There is evidence to indicate that discharges from waste water treatment plants are causing a deterioration in water quality. This evidence is strongest where monitoring stations are located in close proximity upstream and downstream of the location of a discharge.

- 3.2.2.3 All waste water treatment plants were tested for deficiencies, lack of assimilative capacity in the receiving waters, evidence of impact and protected area status. Measures were identified to mitigate the risk and impacts and priority was given in the programme of measures to treatment plants discharging to protected areas.

The methodology for the assessment of the waste water treatment plants is represented in Figure 2.

- 3.2.2.4 The information gathered on waste water treatment plants was reviewed to compare the reported loading to the waste water treatment plant and the design capacity of the treatment plant. Plants were identified that did not appear to have sufficient capacity to cater for the existing loading and the anticipated future loading in 2015.

Where a treatment plant does not have sufficient capacity for the existing water quality, the measure is ***Increase Plant Capacity***. (Included in Table1).

Where the treatment plant does not have capacity to cater for the anticipated loading in 2015 the measure is ***Ensure the Capacity of the Plant is not Exceeded***. (Included in Table 6).

- 3.2.2.5 Information was also gathered on the flow available in the receiving waters and compared against the quantity in the discharge. A determination was made if sufficient dilutions were available in the receiving waters such that water quality standards could be complied with in respect of BOD and Nutrients.

Where it was determined that sufficient dilutions were not available to achieve standards for BOD and where there was evidence of impact from the waste water treatment plant on water quality, the measure is ***Provide Tertiary Treatment or Relocate the Outfall***. (Included in Table 1).

Where it was determined that sufficient dilutions were not available to achieve standards for BOD but there was no evidence of impact from the waste water treatment plant on water quality, the measure is ***Investigate the need for Tertiary Treatment or Relocation of the Outfall***. (Included in Table 2).

Where it was determined that sufficient dilutions were not available to achieve standards for Nutrients and where there was evidence of impact from the waste water treatment plant on water quality, the measure is ***Provide Nutrient Removal or Relocate the Outfall***. (Included in Table 1).

Where it was determined that sufficient dilutions were not available to achieve standards for Nutrients but there was no evidence of impact from the waste water treatment plant on water quality, the measure is ***Investigate the need for Nutrient Removal or Relocation of the Outfall***. (Included in Table 2).

3.2.2.6 Where there was no deficiency identified in the capacity of the treatment plant or in the dilutions available in the receiving waters for the existing loading, the treatment plants were tested against the same criteria based on the anticipated loading in 2015. If the assessment showed that there would be deficit, the measure to be applied to the treatment plant is ***Ensure Capacity of Treatment Plant is not Exceeded***. (Included in Table 6)

3.2.2.7 There are discharges from waste water treatment plants where the monitoring data indicates deterioration in water quality from upstream to downstream of the point of discharge but there is no deficiency evident in either the capacity of the waste water treatment plant or in the dilutions available in the receiving waters. The deterioration in the water quality needs further investigation.

Many urban collection systems incorporate combined sewers that receive sewage and storm water. These combined sewer systems often include combined sewer overflows (CSOs) that allow for the discharge of untreated waste water in storm flow conditions. Where there is a deterioration in water quality that does appear to result from the treated effluent discharge the measure is ***Carry out investigations of the impacts from CSOs***. (Table 5)

Figure 2: Methodology for Identifying Measures and Priority

4.0 PROGRAMME OF MEASURES AND DATES FOR COMPLETION

4.1 Tables of Measures

The measures that have been identified in respect of waste water treatment plants are presented in six tables as follows

- Table 1 – Plants Requiring Capital Investment
 - Provide Secondary Treatment
 - Increase capacity of waste water treatment plant
 - Provide tertiary treatment or relocate outfall
 - Provide nutrient removal or relocate outfall
- Table 2 – Agglomerations Requiring Further Investigations Prior to Capital Works
 - Investigate the need for increase in capacity
 - Investigate the need for tertiary treatment or relocation of the outfall
 - Investigate the need for nutrient removal or relocation of the outfall
- Table 3 – Plants required to commence the implementation of Pollution Reduction Programmes for Shellfish waters.
- Table 4 - Plants Requiring the Implementation of an Appropriate Performance System.
- Table 5 – Agglomerations requiring the Investigation of CSOs
- Table 6 – Plants required to ensure the capacity of the treatment plant is not exceeded.

The agglomerations and waste water treatment plants for which the above measures apply are identified in the tables in the Appendices. These lists result from the methodology described in Section 3 above.

4.2 Dates for Completion

Article 11 of the Water Framework Directive requires the establishment of a programme of measures to achieve the objectives set out in Article 4. The programme of measures is required to be established at the latest nine years after the date of entry into force of the Directive and to be made operational at the latest 12 years after the same date. In this context the programme of measure must be operational by 22nd December 2012.

The measures that have been identified in respect of urban waste water treatment plant discharges include capital works, investigations and management procedures. There are technical constraints and financial considerations that need to be taken into account when setting dates for completion within the programme of measures.

Measures that require capital works are subject to planning and procurement constraints. The planning process can be complex and may involve Environmental Impact Assessments, Compulsory Purchase Orders, Foreshore Licensing, applications for planning permission to An Bord Pleanála, planning appeals and oral hearings, land acquisition and wayleaves. The public procurement process requires competitions for the appointment of consultants and contractors.

The programme for completing a capital works project needs to take into account the timescale for planning and public procurement in addition to the time necessary to complete the Preliminary Report, Site Investigations, Detail Design and preparation of contract documents. Where a project has not yet completed the planning stage it is unlikely that the project can be completed within the timeframe of the first river basin management plan.

The identification of measures to be completed within the first river basin management plan considered the current status of projects and the constraints which would militate against completion by 2015. Many of the measures proposed have featured on Water Services Investment Programmes. Some projects have advanced beyond the planning stage and design stages and completion within the first river basin management plan is achievable. However, for many of the measures it is not possible to implement the measure by December 2012 or indeed prior to December 2015, due to the time required to advance a project from planning to completion of construction.

The Table 1 list of proposed capital works was circulated to the local authorities. Local Authorities were asked to consider the current status of projects and to identify projects that could be completed by 2012 or 2015 and projects where completion would be post 2015.

The dates for completion shown in Table 1 reflect the views of the Local Authorities as to what is practical to complete by 2015. It is expected that projects due for completion by 2015 will feature in the next Water Services Investment Programme.

Where it is not possible to implement measure by 2015 it may be necessary to extend the deadline for achieving objectives for the receiving water body. This matter is addressed in other background documents dealing with extended deadlines.

Measures that do not require capital works nor are subject to planning and procurement constraints are included in the programme of measures for completion within the first river basin management plan timeframe. These are listed in Tables 2 – 6.

In Table 2 the measure requires investigations prior to capital works. The date for completion refers to the completion of the investigations. In most cases the Local Authorities have indicated that the investigation will be completed by 2012. Some Local Authorities have indicated dates for completion beyond 2015.

In Table 3 the measure requires the commencement of the implementation of the Pollution Reduction Programmes (PRP) for shellfish waters. The implementation is to commence immediately the PRPs are made by the Minister under the provisions of the Waste Water Discharge (Authorisation) Regulations, S.I. 684 of 2007, which is expected to occur in 2010. It is recognised that the full implementation of the PRP may not be achievable by 2012 where the measures contained in the PRP require capital works or detailed investigations for which planning and procurement constraints apply.

In Table 4 the measure is implement an appropriate performance management system. This should occur in all cases prior to 2012. The performance management system should address any non-compliance issues concerning the achievement of the required discharge standards and the required frequency of sampling required under the Urban Waste Water Treatment Regulations.

In Table 5 the measure requires investigation of Combined Sewer Overflows (CSOs). In most cases the Local Authorities have indicated that the investigation will be completed by 2012. Some Local Authorities have indicated dates for completion beyond 2015.

In Table 6 the measure requires the steps are taken to ensure that the capacity of the treatment plant is not exceeded. In all cases this should be operational by 2012. This requires procedural arrangements within the local authorities which are programmed to be in place in 2010.

4.3 **Overall Summary**

Information was gathered on 881 waste water treatment plants from the EPA database and information contained in applications made to the EPA for a discharge licence. Information on a further 31 treatment plants was provided directly by local authorities.

Of the 912 treatment plants, 651 were identified as requiring the implementation of measures. The remaining 261 plants were either identified as not causing risk or there was insufficient impact data to determine risk.

Of the 651 plants in the programme of measures, 314 are programmed for completion beyond 2015. Of this number 244 discharges to 219 water bodies designated as less than good status. These water bodies will be considered for extended deadlines taking into consideration the impacts from other pressures which may be the primary cause of less than good status.
